Project Idea • Sarvatra AI

Automated Document Creation Agent

Turn rough bullet points into formatted, ready-to-download Word documents (Letters, Memos, Meeting Minutes) in under 60 seconds — completely offline.

How It Works (The 3-Step Flow)

Step 1

Pick & Describe

Click a template (Letter, Memo, Minutes) or type in chat. Just provide rough notes, subject, and recipient.

Step 2

AI Drafts Body

Local Ollama model writes clear, professional, numbered paragraphs. Fast single-shot call (~8 seconds).

Step 3

Instant Word File

Python packages it into a styled **.docx** file with margins and signatures. One click to download.

Why This Is Good

⚡ Saves 90% of Drafting Time

Drafting routine formal letters and meeting minutes takes 30–45 minutes manually. This generates a complete first draft in under 60 seconds.

🔒 100% Offline & Secure

Runs strictly on local hardware with Ollama. Zero internet required, zero cloud calls — all operational data stays on the machine.

💻 Lightweight & Laptop-Friendly

No heavy multi-agent loops. Python handles 80% of the work (templates, margins, buttons). The local LLM only writes prose. Fast and stable.

📄 Real, Formatted Word Files

Doesn't just dump text in chat — exports real **.docx** files ready for Microsoft Word with auto-filled sender name and department.

Current Status & Next Step

Already Built & Working: Offline local LLM chat • Document text reader (PDF/DOCX) • User logins • Telemetry.
What I'm Adding: The Word (.docx) generation engine + Document preset buttons + Instant in-chat download card.

Proposed Starting Point (Phase 1):

Starting with the top 3 high-impact document types: **Formal Letters, Office Memos, and Meeting Minutes (MoM)**. If this concept sounds practical, I will proceed with building the Word generator and UI integration.
